Coding Standards

File Documentation:
1. Site sources (if any) that were used to write a function
2. Explain (if any) what each parameter of the function does
3. Explain (if any) what the function returns
4. Briefly explain what exactly the function does

Refactoring / Abstraction rules:
1. Styling should be removed from the component and put in the style object at the bottom of the page.
2. Components that will be reused should be abstracted and put into a directory describing what page they were used on.

Good coding practices:
1. Proper Indentation
2. Use Proper Naming Conventions for variable and function names
3. Whenever possible use const instead of var
4. Don't put multiple statements on line.
5. Remove unused import statements
6. Open curly braces on the next line as the statement and close on a new line.
7. Don't add empty lines after opening braces or closing braces.
8. Compile your code without warnings.
9. Parenthesis around conditional statements are not required and should be formatted.
10. For single statements, do not use parentheses.
